

Ex.No.6**Data Wrangling****Aim:**

To do Data Wrangling functions

Description:

Data wrangling is the task in data science and analysis which includes operations

like: Data Sorting: To rearrange values in ascending or descending order.

Data Filtration: To create a subset of available data.

Data Reduction: To eliminate or replace unwanted values.

Data Access: To read or write data files.

Data Processing: To perform aggregation, statistical, and similar operations on specific values.

1. Using join function to join two DataFrames.
2. Using combine function to combine two DataFrames.
3. Using merge function to merge two DataFrames.
4. Using replace function to replace the NaN values by average value.
5. Filtering and dropping the rows and rows and columns respectively.
6. Using concat function to concatenate two DataFrames.
7. Using melt function to reshape the DataFrame dimension.
8. Using groupby function to group the data set.
9. Using duplicated function to remove duplicated rows in the DataFrame
10. Using merge function to merge two DataFrame data sets.
